

- I think one thing that really concerns me about the internet is how websites easily gather personal data, such as your IP address and interactions by means of cookies, and how they handle this data. One thing I find very frustrating is the fact some websites make it very hard to decline cookies, even using browsers such as Brave. It always makes me question, What are they really doing with this data? I know it enhances our experience by showing us personalized results, but the fact they need all this personal data really doubts me. Another thing that really concerns me about the Internet is the amount of websites there exist now with malicious intent, hidden as plain regular websites. Especially with experience with my parents falling for fake websites where you're directed to a fake Instagram login, it's clear how easy people can fall for something like this, especially with how realistic these websites look.
- I get worried about online banking/ scams that could take my savings etc. I get worried when I get posted on my friend's public social media accounts.
- I'm concerned about viruses in stuff downloaded from the internet, and all kinds of scams on the internet.
- I wouldn't necessarily be overly concerned about privacy/security/misinformation, it would be more subtle things like aimlessly accepting cookies on various websites where I have no idea what I'm agreeing to and the implications accepting them might have on me.
- Concerned about where my data is going and who has access to it. Worried about the use of AI and the impacts that is having with regards to misinformation.
- My main concern is the risk of online scams and identity theft. It seems increasingly difficult to tell the difference between legitimate websites and phishing attempts or fraudulent links. I am concerned about phishing scams where fake websites pretend to be official banking apps or login pages. It worries me how easily people can get tricked into entering their passwords and having their accounts compromised. I also worry about how easy it is to encounter fake news and misinformation on social media.
- I am concerned about AI's ability to conjure up false information when it fails to find a real correct answer to its prompt. I am also concerned by the extent of the information that social media extracts from you and how well online retailers know what you are looking for. For example many times I have discussed a product in person and then 30 mins later scrolled on tiktok to find that product advertised.
- I'm concerned about how my data is used and about surveillance through the apps I use. I'm also extremely concerned about AI and how it is causing cognitive decline, reaffirms and further biases people's opinions and spreads set agendas.
- I will say that my main concern is that when companies take more information out of you of what they actually say they are taking, because of this we have no control of the amount of information they are taking from us. Also, now with AI, There a much more issues with misinformation with hallucinations of the AI.
- There is a growing trend of subscribing to all services online and never actually having waning the software that you download. The majority of experiences online are being made worse by filling them with adds
- the overuse of ai and growing spread of misinformation online because of it
- Specific: A medical professional submitted some of my medical data into gen AI so I now have major concerns regarding my medical history privacy and GDPR violation.
- General: concerns about constantly being tracked ,monitored, "manipulated " (e.g into buying things ,spending more money),radicalization of certain ideas ,echo chambers, AI psychosis
- Perishing because my metadata gave me away
- digital footprint, sharing personal information, stalking, ai
- Cookies, AI using my data, deepfakes, password security, data breaches, fraud and scams, widespread misinformation catalysing political movements, attention span manipulation
- I have concerns about data security mostly, I don't think I know enough about the internet to understand just how much of my data is collected and often shared with third parties. Also, not sure how much it relates to the internet necessarily, but the super widespread use of generative AI is also a bit worrisome.
- I sign up for lots of websites with my email and phone number. For example, if I want to use an editing app or buy something online, I usually need to log in. I worry about how many data centres store my information from this, and even more important information like bank details and whatnot. I've also been hacked on Instagram before, and it was pretty terrifying, so that's a worry too.
- I worry sometimes after I accept cookies because I don't have time to go through everything and see what exactly I've accepted

- I'm concerned about an online "profile" being constructed about an individual and this profile being distributed between companies for monetary gain, advertisement effectiveness, etc. Stuff like saying you want something in a Whatsapp text, then seeing an ad for it on Instagram
- I'm also concerned about deliberately addictive algorithms, and the cognitive damage they do, though I myself am occasionally engrossed in them.
- I just don't want my phone number or emails being leaked
- In our time, when data is turned into a commodity for enterprise, data leaks have become frequent and common. Selling of sensitive user data over the dark web with the services available truly make it a security threat, as in this age a person could know everything about your life and if determined enough could poison it from the roots.
- AI being used to make deep fakes of me and my loved ones without consent is an incredibly grim thought. Impersonation and identity fraud is something that sometimes worries me too, and I'm not sure how worried I should be about it.
- Mass surveillance disguised as safety for children
- I'm concerned that corporations may know more about me than friends/family. Also concerned with my screen time and having access to infinite content at all times and how that affects my well-being (happiness, work ethic, never bored from constant stimulation).
- The spread of misinformation and the radicalisation of harmful idealisations such as the likes of misogyny that is being fed to young boys, "black pill" and "red pill" theory created by the "manosphere". The influx of xenophobia and homophobia that is being noted on the internet is equally concerning.
- Privacy and data usage is also a concern of mine as well as I was recently informed of an ongoing example of this, in this case being a period tracker app called Flo and their misuse of women's personal information. The company was sharing women's data without their permission.
- Misinformation spreading quickly and leaving large numbers of people ill-informed, forming strong conclusions on fragile foundations they believe to be certain
- Not particularly, just the usual concern of how much of my personal information is being shared between companies online for the purpose of advertising.
- The growing use of surveillance chat control and other infringements used for internet safety which can wrongfully scan private conversations or photos without consent, Data scraping and other uses of AI which can infringe on one's privacy on the internet as well as AI's use of literature which can lead to historic books being used and destroyed in the process of teaching models. Humans over reliance on AI and abandoning reading to summarise information.
- How shortform content is deteriorating the brain's attention span and impulse control. how short form content and "meme" are used to further desensitise people from extremely serious topics.
- Non-consensual sharing and manipulation of images, text or likeness Content algorithms that put people in sociopolitical echo chambers
- User privacy and personal data management
- One concern I have about the Internet is privacy, particularly how much personal information websites and apps can collect, track, and store without users fully realising it. I am also concerned about misinformation spreading quickly online and appearing trustworthy, especially on social media.
- Videos seen on tiktok or X
- How easily personal information gets leaked online and the seeming lack of consequences for those (on both sides) responsible for the breaches.
- What information is being collected and who exactly can access that.
- new EU laws
- Mainly data collect in order to tailor future search results as I feel that's a slippery slope in terms of information control
- Having experienced a credit card fraud incident, I am really concerned about the security of personal information
- I am concerned about the idea or possibility of your data being used to profile you in legal situations or even in job screenings
- I'm worried about the advances in surveillance technology and Facial ID data as some countries seem to be heading in the direction of becoming a surveillance state
- I am very concerned about misinformation issue, specially with the upcoming of IA but also with the different algorithm. For example, when I interact with a point of view about a subject on Instagram, I will have only content about this point of view.
- It's concerning how apps and products shown on your phone can cater to your interests in such specific detail. It's concerning to imagine the amount of information companies have on you as a

whole.

- Access to inappropriate content for young people and chat rooms etc. how much of your personal information is available somewhere like posts and images.
- Whenever I talk about something in person, I tend to get similar ads on YouTube or chrome related to that topic.
- Privacy violations, not in an advertisement sense but a slow build up and normalisation of surveillance particularly in countries falling into more extreme governments such as the US.
- worried about my information, particularly information on my health, will be used
- I am concerned that they are harvesting my data to sell to big corporations for advertising and that the apps are designed to be so addictive and harmful to your mental health.
- How much data they have on me. How targeted ads sometimes seem to be things that I have said aloud, separately from the internet.
- My major concerns regarding the internet relate to freedom of information, and a right to privacy. In relation to freedom of information, I think our right to share resources amongst each other (a fundamental part of the internet) is being consistently challenged. With privacy, I think our collected data, and especially of which we are unaware of or is currently unregulated (say data aggregated via unexpected means and linked together to build and sell a profile of a person to advertisers), is a bigger concern than people realise.
- Broadly worried about the tracking of data, cataloging of personal information, and increased required use of biometric data like fingerprints or face scans. Similarly worried about seemingly every service integrating AI in some way, no matter how frivolous.
- I'm concerned about the amount of AI generated content on the internet
- My main concern is how websites need our personal information or even a paid subscription just to access them.
- Unnecessary use of AI in almost every website and app
- I am concerned about how much of my data is leaked into the public domain and used by third-party services, particularly through the use of AI platforms.
- I am worried about the surveillance performed by both government and corporate elements
- data handling, security of banking/financial apps or sensitive public information
- Digital privacy and data harvesting are a big concern, as are disinformation operations.
- The thing that concerns me most about the internet is identity theft. Especially today when deepfakes are becoming increasingly common, identity theft and defamation can happen very easily.
- The things I am particularly concerned related to the Internet is privacy, a lot of passwords related to our social media accounts often appear in data leaks. Also, I feel that we are sharing a lot of information with AI tools that we use daily. Oversharing with tools like ChatGPT is something I feel we might not pay attention to at first but it is something that might pose a problem in the future.
- Online shopping-cc being hacked
- There being a record of my search history (stupid Qs asked, personal data revealed etc)
- I'm concerned about the lack of privacy and of the huge amount of traffic, data brokers and mass surveillance/ propaganda machines
- privacy , app tracking , personal info getting leaked
- Privacy and security issues surrounding personal information that is being gathered by websites.
- Powerful AI producing life-like videos to promote fake news. Not the videos that fool your granny but legitimately high quality AI videos.
- Algorithms in general are very worrying, in the sense that they can keep users in feedback loops of misinformation and echo chambers using manipulated feeds. The prevalence of bots particularly ones that amplify and spread fake or deceptive information as well as deepfakes.
- Privacy and app tracking. Selling of personal data and phishing of financial details and identity theft.
- Mainly the spread of misinformation and propaganda, and harmful ideals/images towards young people in terms of body image, what success is, relationship ideas, etc
- My personal data being shared without my knowledge because I'm too lazy to read all the terms and conditions. How easily misinformation can spread so quickly and how there are so many contradictory claims it's hard to know which is true.
- I am concerned about how easily misinformation spreads online and how websites and apps can track users' browsing habits, locations, and online activity without them fully realising it.
- data storage and my data ending up in the wrong hands.
- AI generated posts and misinformation, lack of privacy also.
- AI being used to crack encryption at mass scale.
- I'm concerned about privacy and the use of my data.

- I'm worried about fake news and ai generated content being overly used nowadays that it's difficult to tell what's real and what not, kids might be more gullible into believing everything they see.
